DevOps Lab Assessment Questions

1. TW1 - Continuous Evaluation: Foundational DevOps Skills (10 Marks)

Instructions: Complete the following tasks in your lab environment. Document your commands and outputs as evidence.

Scenario: You are a developer working on a new feature for a web application.

1. Git Workflow & Collaboration (4 Marks)

- **Task 1.1:** Initialize a new Git repository for a simple "Hello World" Python Flask application (provided to you). Add the initial code and commit it to the main branch. (1 Mark)

New repository

Search Type to search

Create a new repository

Repositories contain a project's files and version history. Have a project elsewhere? [Import a repository.](#)
Required fields are marked with an asterisk (*).

1 General

Owner * ohmschrodinger / Repository name * devops
✔ devops is available.

Great repository names are short and memorable. How about [scaling-chainsaw](#)?

Description
0 / 350 characters

2 Configuration

Choose visibility *
Choose who can see and commit to this repository Public

Start with a template
Templates pre-configure your repository with files. No template

- **Task 1.2:** Create a new branch named `feature/user-auth`. Make a small modification (e.g., add a new print statement) in this branch, commit the changes, and push the branch to a remote repository (e.g., GitHub/GitLab). (1.5 Marks)

- **Task 1.3:** Simulate a conflict: On the main branch, modify the *same line* you changed in feature/user-auth. Commit this change. Now, attempt to merge feature/user-auth into main. Resolve the merge conflict manually and commit the resolution. Push the updated main branch. (1.5 Marks)

2. Jira Project & Issue Tracking (3 Marks)

- **Task 2.1:** Log in to your free Jira Cloud instance. Create a new "Scrum" project for the "Hello World" application. (1 Mark)

- **Task 2.2:** Create the following issues within your new project:
 - One "Story" titled "Implement User Authentication Feature".

Create Story

Required fields are marked with an asterisk *

- One "Task" titled "Setup Flask Environment".

- One "Bug" titled "Login Page Displays Error". (1 Mark)

- **Task 2.3:** Navigate to the project's board. Move the "Setup Flask Environment" task from "To Do" to "In Progress". (1 Mark)

3. Basic Containerization (Docker) & Jenkins Freestyle Project (3 Marks)

- **Task 3.1:** Create a Dockerfile for your Python Flask "Hello World" application. The Dockerfile should build a minimal image that runs the application on port 5000. Build the Docker image locally and verify it runs correctly. (1.5 Marks)

- **Task 3.2:** Set up a Jenkins Freestyle project. Configure it to pull your Git repository (from Task 1.1) and execute a build step that lists the contents of the workspace. Trigger a build and provide a screenshot of the successful build output. (1.5 Marks)

New Item

Enter an item name

Hello-Flask

Select an item type

Pipeline

Build, test, and deploy using pipelines. Supports stages, parallel work, and running on multiple agents.

Freestyle project

Classic, general-purpose job type that checks out from up to one SCM, executes build steps serially, followed by post-build steps like archiving artifacts and sending email notifications.

Multi-configuration project

Suitable for projects that need a large number of different configurations, such as testing on multiple environments, platform-specific builds, etc.

Folder

Creates a container that stores nested items in it. Useful for grouping things together. Unlike view, which is just a filter, a folder creates a separate namespace, so you can have multiple things of the same name as long as they are in different folders.

2. TW2 - Continuous Evaluation: Advanced DevOps Practices (10 Marks)

Instructions: Build upon your previous work. Document your commands, configuration files (e.g., docker-compose.yml, Kubernetes YAMLs), and outputs.

Scenario: You need to enhance your "Hello World" application to include a database and deploy it using orchestration tools.

1. Docker Compose for Multi-Container App (3 Marks)

- **Task 1.1:** Modify your "Hello World" Flask application to include a simple PostgreSQL database (e.g., the app connects to and stores a single entry). (1 Mark)

```
app.py 2. M X requirements.txt M Dockerfile docker-compose.yml U
app.py > home
1  from flask import Flask
2  import psycopg2
3  import time
4
5  app = Flask(__name__)
6
7  print("User authentication feature branch initialized.")
8
9
10 def get_db_connection():
11     while True:
12         try:
13             conn = psycopg2.connect(
14                 host="db",
15                 database="hello_db",
16                 user="postgres",
17                 password="password"
18             )
19             return conn
20         except Exception:
21             print("Database not ready, waiting...")
22             time.sleep(2)
23
24
25
26
27 @app.route("/")
28 def home():
29     conn = get_db_connection()
30
31     cursor = conn.cursor()
32
33     cursor.execute("""
34         CREATE TABLE IF NOT EXISTS messages(
35             id SERIAL PRIMARY KEY,
36             message TEXT
37         )
38     """)
39
40
41     cursor.execute(
42         "INSERT INTO messages(message) VALUES(%s)",
43         ("Hello from Flask + PostgreSQL",)
44     )
45
46
47     conn.commit()
48
49     cursor.close()
50     conn.close()
51
52     return "Hello World! Data stored in PostgreSQL."
53
54
55
```

```
55
56 if __name__ == "__main__":
57
58     app.run(
59         host="0.0.0.0",
60         port=5000,
61         debug=True
62     )
```

- **Task 1.2:** Create a docker-compose.yml file that defines two services: your Flask application and the PostgreSQL database. Configure them to communicate. Bring up the

application using docker-compose up and verify both services are running and communicating. Provide the docker-compose.yml and output. (2 Marks)

```
docker-compose.yml
5   flask-app:
6     build: .
7     container_name: flask-container
8     ports:
9       - "5000:5000"
10    depends_on:
11      - db
12
13
14    db:
15      image: postgres:16
16      container_name: postgres-container
17
18      environment:
19        POSTGRES_USER: postgres
20        POSTGRES_PASSWORD: password
21        POSTGRES_DB: hello_db
22
23      ports:
24        - "5432:5432"
```

```

2. Kubernetes Deployment & Service (4 Marks)

- Task 2.1: Ensure your Docker image from TW1 (or an updated one) is accessible (e.g., pushed to a public Docker Hub repository, or Minikube's Docker daemon is used). (1 Mark)

```
PS C:\Users\omdha> minikube start
* minikube v1.38.1 on Microsoft Windows 11 Home Single Language 25H2
* Automatically selected the docker driver
! Starting v1.39.0, minikube will default to "containerd" container runtime. See #21973 for more info.
* Using Docker Desktop driver with root privileges
* Starting "minikube" primary control-plane node in "minikube" cluster
* Pulling base image v0.0.50 ...
* Downloading Kubernetes v1.35.1 preload ...
  > preloaded-images-k8s-v18-v1...: 272.45 MiB / 272.45 MiB 100.00% 9.66 Mi
  > gcr.io/k8s-minikube/kicbase...: 519.58 MiB / 519.58 MiB 100.00% 7.47 Mi
* Creating docker container (CPUs=2, Memory=4000MB) ...
* Preparing Kubernetes v1.35.1 on Docker 29.2.1 ...
* Configuring bridge CNI (Container Networking Interface) ...
* Verifying Kubernetes components...
  - Using image gcr.io/k8s-minikube/storage-provisioner:v5
* Enabled addons: storage-provisioner, default-storageclass
* Done! kubectrl is now configured to use "minikube" cluster and "default" namespace by default
```

```
PS C:\Users\omdha> docker ps
CONTAINER ID   IMAGE                                NAMES      COMMAND                  CREATED        STATUS        PORTS

* Opening service default/flask-service in default browser...

! Because you are using a Docker driver on windows, the terminal needs to be open to run it.

Hello World! Data stored in PostgreSQL.

3. Integrated CI/CD with Jenkins & Basic Infrastructure as Code (IaC) (3 Marks)

- **Task 3.1:** Create a Jenkins Declarative Pipeline that performs the following steps:
 - Checks out your Git repository.

- Builds the Docker image for your Flask application (from Task 1.1).
- (Optional but Recommended for higher scores): Pushes the built Docker image to a registry. (2 Marks)

```
Jenkinsfile
1 pipeline {
2   agent any
3
4   stages {
5
6     stage('Checkout') {
7       steps {
8         git 'https://github.com/ohmschrodinger/devops.git'
9       }
10    }
11
12    stage('Build Docker Image') {
13      steps {
14        bat 'docker build -t devops-flask-app .'
15      }
16    }
17
18    stage('List Docker Images') {
19      steps {
20        bat 'docker images'
21      }
22    }
23
24    // Optional
25    stage('Push Docker Image') {
26      when {
27        expression { false } // Change to true after docker login
28      }
29      steps {
30        bat 'docker push ohmschrodinger/devops-flask-app:latest'
31      }
32    }
33  }
34 }
```

| Ohm Schrodinger at 10:29 28/07/2026

- **Task 3.2:** Install Terraform. Write a simple Terraform configuration (main.tf) to create a local file (e.g., output.txt) with some content. Initialize, plan, and apply the configuration. Show the output of terraform plan and verify the file creation. (1 Mark)

```
terraform-demo > main.tf

1 terraform {
2   required_providers {
3     local = {
4       source = "hashicorp/local"
5       version = "~> 2.5"
6     }
7   }
8 }
9
10 provider "local" {}
11
12 resource "local_file" "example" {
13   filename = "output.txt"
14   content = "Hello from Terraform!"
15 }
```

Windows PowerShell

```
PS Z:\Om\SIT\Semester 7\DevOps Lab\assignment\devops\terraform-demo> terraform init
Initializing the backend...
```

Initializing provider plugins...

- Finding hashicorp/local versions matching "~> 2.5"...
- Installing hashicorp/local v2.9.0...
- Installed hashicorp/local v2.9.0 (signed by HashiCorp)

Terraform has created a lock file `.terraform.lock.hcl` to record the provider selections it made above. Include this file in your version control repository so that Terraform can guarantee to make the same selections by default when you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see any changes that are required for your infrastructure. All Terraform commands should now work.

If you ever set or change modules or backend configuration for Terraform, rerun this command to reinitialize your working directory. If you forget, other commands will detect it and remind you to do so if necessary.

```
PS Z:\Om\SIT\Semester 7\DevOps Lab\assignment\devops\terraform-demo> terraform plan
```

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:

+ create

Terraform will perform the following actions:

```
# local_file.example will be created
+ resource "local_file" "example" {
  + content           = "Hello from Terraform!"
  + content_base64sha256 = (known after apply)
  + content_base64sha512 = (known after apply)
  + content_md5       = (known after apply)
  + content_sha1      = (known after apply)
  + content_sha256    = (known after apply)
  + content_sha512    = (known after apply)
  + directory_permission = "0777"
  + file_permission   = "0777"
  + filename          = "output.txt"
  + id                = (known after apply)
}
```

Plan: 1 to add, 0 to change, 0 to destroy.

```
Note: You didn't use the -out option to save this plan, so Terraform can't guarantee to take exactly these actions if
you run "terraform apply" now.
PS Z:\Om\SIT\Semester 7\DevOps Lab\assignment\devops\terraform-demo> terraform apply

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the
following symbols:
+ create

Terraform will perform the following actions:

# local_file.example will be created
+ resource "local_file" "example" {
  + content          = "Hello from Terraform!"
  + content_base64sha256 = (known after apply)
  + content_base64sha512 = (known after apply)
  + content_md5       = (known after apply)
  + content_sha1      = (known after apply)
  + content_sha256    = (known after apply)
  + content_sha512    = (known after apply)
  + directory_permission = "0777"
  + file_permission   = "0777"
  + filename          = "output.txt"
  + id                = (known after apply)
}

Plan: 1 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?
  Terraform will perform the actions described above.
  Only 'yes' will be accepted to approve.

Enter a value: yes

local_file.example: Creating...
local_file.example: Creation complete after 0s [id=cadbafd9572a72dc7769c97730552f5955e135fd]

Apply complete! Resources: 1 added, 0 changed, 0 destroyed.
PS Z:\Om\SIT\Semester 7\DevOps Lab\assignment\devops\terraform-demo> type output.txt
Hello from Terraform!
PS Z:\Om\SIT\Semester 7\DevOps Lab\assignment\devops\terraform-demo>
```

3. TW3 - ESE Lab Exam + Project Evaluation + Viva (30 Marks)

Instructions: This is a comprehensive assessment that combines practical lab work with a project implementation and a viva-voce.

A. ESE Lab Exam (10 Marks)

Scenario: You are tasked with setting up a fully functional CI/CD pipeline for a given multi-service application (e.g., a simple microservice architecture with a frontend, backend, and database).

- **Task:** Given a multi-service application (frontend, backend, database components), implement a complete CI/CD pipeline from scratch.
 - Initialize a Git repository and set up a basic branching strategy.
 - Utilize Jira to create and track issues related to the deployment.
 - Develop a Jenkins pipeline that:
 - Pulls code from Git.
 - Builds Docker images for each service.
 - Pushes images to a Docker registry.
 - Deploys the services to a local Kubernetes cluster.

```
1 pipeline {
2   agent any
3
4   environment {
5     IMAGE_BACKEND = 'ohmschrodinger/backend:v1'
6     IMAGE_FRONTEND = 'ohmschrodinger/frontend:v1'
7   }
8
9   stages {
10    stage('Checkout') {
11      steps {
12        checkout scm
13      }
14    }
15
16    stage('Build Backend') {
17      steps {
18        script {
19          if (isUnix()) {
20            sh 'docker build -t $IMAGE_BACKEND ./backend'
21          } else {
22            bat 'docker build -t %IMAGE_BACKEND% ./backend'
23          }
24        }
25      }
26    }
27
28    stage('Build Frontend') {
29      steps {
30        script {
31          if (isUnix()) {
32            sh 'docker build -t $IMAGE_FRONTEND ./frontend'
33          } else {
34            bat 'docker build -t %IMAGE_FRONTEND% ./frontend'
35          }
36        }
37      }
38    }
39  }
40 }
```

```

Started 1 min 9 sec ago
Took 26 sec

The screenshot displays the Jenkins web interface for a pipeline named 'tw1.3'. The pipeline is currently at stage '#2', which is 'Deploy'. The pipeline status is 'Completed' (indicated by a green checkmark). The pipeline was started by 'Ohm Schrodinger' and took 5.7 seconds to complete on the built-in executor. The pipeline consists of the following stages: Checkout SCM, Checkout, Build Backend, Build Frontend, Push Images, and Deploy. The 'Deploy' stage is currently running, with a duration of 80ms. The 'Deploy' stage is further broken down into a sub-stage 'Deploying to Kubernetes', which has a duration of 15ms. The pipeline is running on Jenkins 2.572.

Evaluation Rubric (Lab Exam - 10 Marks):

- **Problem Solving & Practical Application (5 Marks):** Ability to correctly set up, configure, and integrate all required tools to achieve the functional pipeline.
- **Accuracy & Efficiency of Solution (3 Marks):** The pipeline should run smoothly without manual intervention, and the deployed application should be fully functional.
- **Troubleshooting & Debugging (2 Marks):** Ability to quickly identify and resolve any issues encountered during the setup and execution.

B. Project Evaluation (10 Marks)

Instructions: Develop a small-scale DevOps project that demonstrates your understanding and integration of at least 4-5 core DevOps tools (e.g., Git, Jira, Jenkins, Docker, Kubernetes, Terraform, Prometheus/Grafana for monitoring, Ansible for configuration management).

Project Idea (Example): Build a "Personal Blog Application" with a CI/CD pipeline.

- **Requirements:**
 - The application should be version-controlled using Git.
 - Use Jira for project and issue tracking.
 - Implement a Jenkins pipeline for continuous integration and continuous delivery.

- Containerize the application using Docker.
- Deploy the containerized application to a Kubernetes cluster.
- Use Terraform for provisioning at least one infrastructure component (e.g., a persistent volume for the blog data).
- (Optional for higher scores): Implement basic monitoring using Prometheus/Grafana or automated testing.

Evaluation Rubric (Project - 10 Marks):

- **Project Design & Architecture (3 Marks):** How well are the DevOps tools integrated? Is the architecture sound and scalable?
- **Functionality & Completeness (3 Marks):** Does the project work as intended? Are all specified requirements met?
- **Code Quality & Best Practices (2 Marks):** Readability, comments, adherence to best practices for Dockerfiles, Jenkinsfiles, Kubernetes YAMLs, and Terraform configurations.
- **Documentation & Presentation (2 Marks):** Clarity and completeness of project documentation (e.g., README.md, setup instructions, architecture diagrams if any) and effectiveness of the project demonstration.

C. Viva (10 Marks)

Instructions: Be prepared to answer questions related to your ESE Lab Exam and Project, as well as general DevOps concepts.

Evaluation Rubric (Viva - 10 Marks):

- **Understanding of Concepts (4 Marks):** Ability to clearly explain the theoretical concepts behind the tools used, the CI/CD pipeline, containerization, orchestration, and IaC.
- **Problem-Solving & Critical Thinking (3 Marks):** Ability to discuss challenges faced during the lab/project and how they were overcome, as well as to propose alternative solutions.
- **Clarity of Explanation & Communication (3 Marks):** Articulation and confidence in explaining technical details and answering questions.
