Jira Project & Issue Tracking:

Step 1: Sign Up for a Free Jira Cloud Instance

1. **Navigate to the Signup Page:** Open your web browser and go to the Atlassian Jira Free plan page. A good starting point is usually <https://www.atlassian.com/software/jira/free>. (You can also search for "Jira Cloud Free").
 2. **Start Signup:** Look for buttons like "Get it free" or "Sign up free" and click on one.
 3. **Create Atlassian Account:** You'll likely be prompted to sign up for an Atlassian account. You can usually sign up with your email address and a password, or often use existing Google or Microsoft accounts. Follow the prompts.
 4. **Set Up Your Site:** During the signup, you'll need to choose a unique name for your Jira site. This will form your Jira URL (e.g., `your-chosen-name.atlassian.net`). Choose something relevant to you or your team/project.
 5. **Select Product & Plan:** Ensure "Jira Software" is selected. When prompted for a plan, choose the **Free** plan. This plan typically allows up to 10 users and offers core Jira functionality, sufficient for this exercise.
 6. **Initial Questions (Optional):** Jira might ask some questions about your team size, role, or how you intend to use Jira. You can often skip these or provide simple answers. Once ready, you should be logged into your new Jira Cloud instance.
-

Step 2: Create a New Project (Scrum or Kanban)

1. **Find "Create Project":** Once logged into your Jira site (`your-chosen-name.atlassian.net`), look for a prominent button or menu option like "Create project". This might be in the main navigation menu (often on the left or top) or on the dashboard.
2. **Choose a Template:** Jira offers various project templates. You need to choose either **Kanban** or **Scrum**.
 - **Kanban:** Good for continuous flow, visualizing work, and managing tasks with a simple workflow (e.g., To Do, In Progress, Done). Often recommended for simpler projects or service-oriented teams.
 - **Scrum:** Designed for iterative development in fixed-length cycles called "sprints". Includes features like Backlogs for planning future work and Sprint Boards for tracking current sprint work. Often used for product development.
 - For this exercise, **select either "Kanban" or "Scrum"**. Find the relevant template (it might just be called "Kanban" or "Scrum") and click "Use template" or "Select".
3. **Select Project Type (if prompted):** You might be asked to choose between "Team-

managed" and "Company-managed".

- **Team-managed:** Simpler configuration, managed by the project team. **Recommended for this exercise** if the option is presented clearly.
- **Company-managed:** More powerful customization, shared configurations across projects, typically managed by Jira administrators.
- Select "Team-managed" if available.

4. *Enter Project Details:*

- **Name:** Give your project a meaningful name (e.g., My Website Project).
- **Key:** Jira will automatically suggest a short Key (e.g., MWP). This key prefixes all issue IDs in this project (e.g., MWP-1, MWP-2). You can usually customize it, but the suggestion is often fine.

5. **Create:** Click the "Create project" or "Next" button to finalize the project setup. You should be taken to your new project's main page or board.

Step 3: Create Issues (Story, Task, Bug)

1. **Locate the "Create" Button:** Find the main "Create" button. It's usually located prominently in the top navigation bar of Jira.
2. *Create the Story:*
 - Click "Create". A dialog box or screen will appear.
 - Ensure the **Project** selected is the one you just created (My Website Project).
 - Change the **Issue Type** to **Story**. (Stories typically represent user-facing features or requirements).
 - In the **Summary** field (the title), enter: Develop login page.
 - (Optional) Add a **Description** like "User should be able to log in using email and password."
 - Click **Create**.
3. *Create the Task:*
 - Click "Create" again.
 - Ensure the correct **Project** is selected.
 - Change the **Issue Type** to **Task**. (Tasks usually represent work items needed to support development, chores, or actions).
 - In the **Summary**, enter: Set up database.
 - Click **Create**.
4. *Create the Bug:*
 - Click "Create" one more time.
 - Ensure the correct **Project** is selected.
 - Change the **Issue Type** to **Bug**. (Bugs represent defects or problems in the product).
 - In the **Summary**, enter: Submit button not working.
 - (Optional) Add a **Description** like "Clicking the submit button on the contact form does nothing."
 - Click **Create**.

Step 4: View and Move Issues on the Board

1. **Navigate to the Board:** If you're not already there, use the left-hand project sidebar menu to navigate to your project's **Board**.
 - If you chose **Kanban**, it will likely be called "Kanban board".
 - If you chose **Scrum**, it might be called "Board" or "Active sprints". (Note: In Scrum, newly created issues often land in the "Backlog" first. You might need to navigate to the "Backlog" view, select issues, and move them to a new or existing Sprint to make them appear on the active Sprint Board's "To Do" column). For simplicity, we'll assume Kanban or that you've moved issues to the active sprint in Scrum.
2. **Identify Board Columns:** Observe the columns on the board. A typical simple workflow is:
 - To Do (or Open)
 - In Progress
 - Done (or Closed, Resolved) Your template might have slightly different names or additional columns.
3. **See Initial State:** Your newly created issues (Develop login page, Set up database, Submit button not working) should appear as cards in the leftmost column (To Do).
4. **Simulate Work: Drag and drop** the issue cards to represent work progression:
 - Drag the **"Set up database" (Task)** card from the To Do column to the In Progress column. (You've started working on it).
 - Drag the **"Develop login page" (Story)** card from To Do to In Progress. (Work has begun on the story).
 - Imagine some time passes. Drag the **"Set up database" (Task)** card from In Progress to the Done column. (You've finished setting up the database).
 - Drag the **"Submit button not working" (Bug)** card from To Do to In Progress. (Someone started investigating the bug).
 - Imagine more time passes. Drag the **"Develop login page" (Story)** card from In Progress to Done.
 - Drag the **"Submit button not working" (Bug)** card from In Progress to Done. (The bug has been fixed and verified).

Verification:

- You have successfully created three different types of issues in your Jira project.
- You can see these issues visually represented as cards on your Kanban or Scrum board.
- You were able to change the status of these issues by dragging and dropping them between workflow columns (e.g., To Do -> In Progress -> Done).
